

INVESTIGATION OF THE ENERGY FLEXIBILITY POTENTIAL OF DANISH RESIDENTIAL BUILDING ARCHETYPES

RASMUS ELBÆK HEDEGAARD

PROJECT: LOCAL HEATING CONCEPTS
FUNDED BY EUDP (PROJECT NUMBER 64017-0019)

REQUIRED CAPACITY IN DISTRIBUTION NETWORKS

Consumption composed of:

- Space heating
- Domestic hot water usage
- Heat losses in the distribution network

*Data generously provided by district heating supplier *AffaldVarme Aarhus*

REQUIRED CAPACITY IN DISTRIBUTION NETWORKS

Consumption composed of:

- Space heating
- Domestic hot water usage
- Heat losses in the distribution network

+ Redundancy requirements (often n-1 criteria)
= **Oversized components for majority of year**

*Data generously provided by district heating supplier *AffaldVarme Aarhus*

REQUIRED CAPACITY IN DISTRIBUTION NETWORKS

Consumption composed of:

- Space heating
- Domestic hot water usage
- Heat losses in the distribution network

+ Redundancy requirements (often n-1 criteria)
= **Oversized components for majority of year**

Removing the **50 hours** with highest consumption for each year yields significant capacity reductions.

Production: 14.3% - 17.7%

Demand: 13.5% - 16.5%

*Data generously provided by district heating supplier *AffaldVarme Aarhus*

ENERGY FLEXIBLE BUILDINGS

Objective :

Shift consumption to lower peak demand.

ENERGY FLEXIBLE BUILDINGS

Objective:

Shift consumption to lower peak demand.

Principle:

Utilize the inherent thermal capacity of buildings to shift consumption without impacting comfort.

CASE STUDY: CITY EXPANSION SCENARIO

CASE STUDY: CITY EXPANSION SCENARIO

Questions:

1. To what extent can energy flexibility lower the required capacity of the neighborhood?
2. Should efforts be focused on making a given type of building flexible?

CASE STUDY: CITY EXPANSION SCENARIO

Questions:

1. To what extent can energy flexibility lower the required capacity of the neighborhood?
2. Should efforts be focused on making a given type of building flexible?

Method:

- 1: Establish dynamic models of buildings
- 2: Perform multiple simulations of the area with different groups of buildings being flexible.

ARCHETYPE MODELLING

Archetype modelled:

- Archetype 1: 1951-1960
- Archetype 2: 1979-1998
- Archetype 3: 2011-2015

Physics-based second-order RC-Model

ARCHETYPE MODELLING

Archetype modelled:

- Archetype 1: 1951-1960
- Archetype 2: 1979-1998
- Archetype 3: 2011-2015

Calibration of dynamic archetype models

1. Smart-meter consumption measurements
Sample: Six months worth of data from 100 buildings
2. Weather data (Temperature and solar radiation)
3. Prior knowledge (our best beliefs)

MODELS VS REALITY

Prediction of Archetype 1

No. of buildings: 1000

Time resolution of visualization: 1h

No. of stochastic simulations per building: 1

Prediction of Archetype 2

No. of buildings: 1000

Time resolution of visualization: 1h

No. of stochastic simulations per building: 1

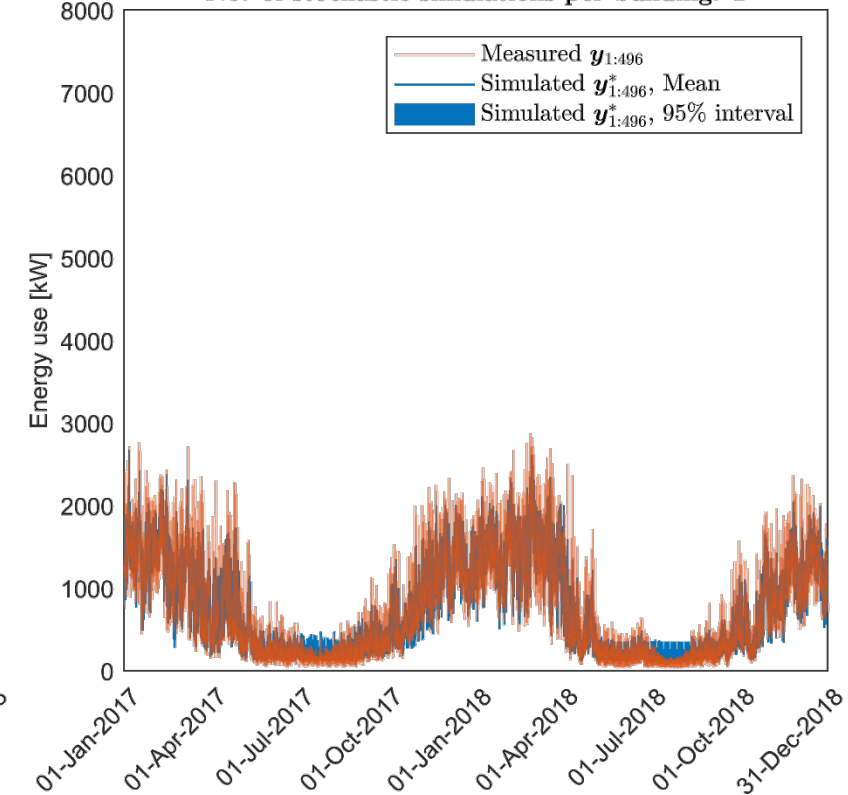

Prediction of Archetype 3

No. of buildings: 496

Time resolution of visualization: 1h

No. of stochastic simulations per building: 1

SIMULATION OF DEMAND RESPONSE

SIMULATION OF DEMAND RESPONSE

SIMULATION OF DEMAND RESPONSE

SIMULATION OF DEMAND RESPONSE

RESULT & BREAKDOWN

RESULT & BREAKDOWN

RESULT & BREAKDOWN

MAIN FINDINGS

Results indicated:

1. Significant capacity reductions may be achieved with only a modest increase in overall consumption.
2. Performance affected by:
 - Comfort preferences of occupants
 - Building energy efficiency

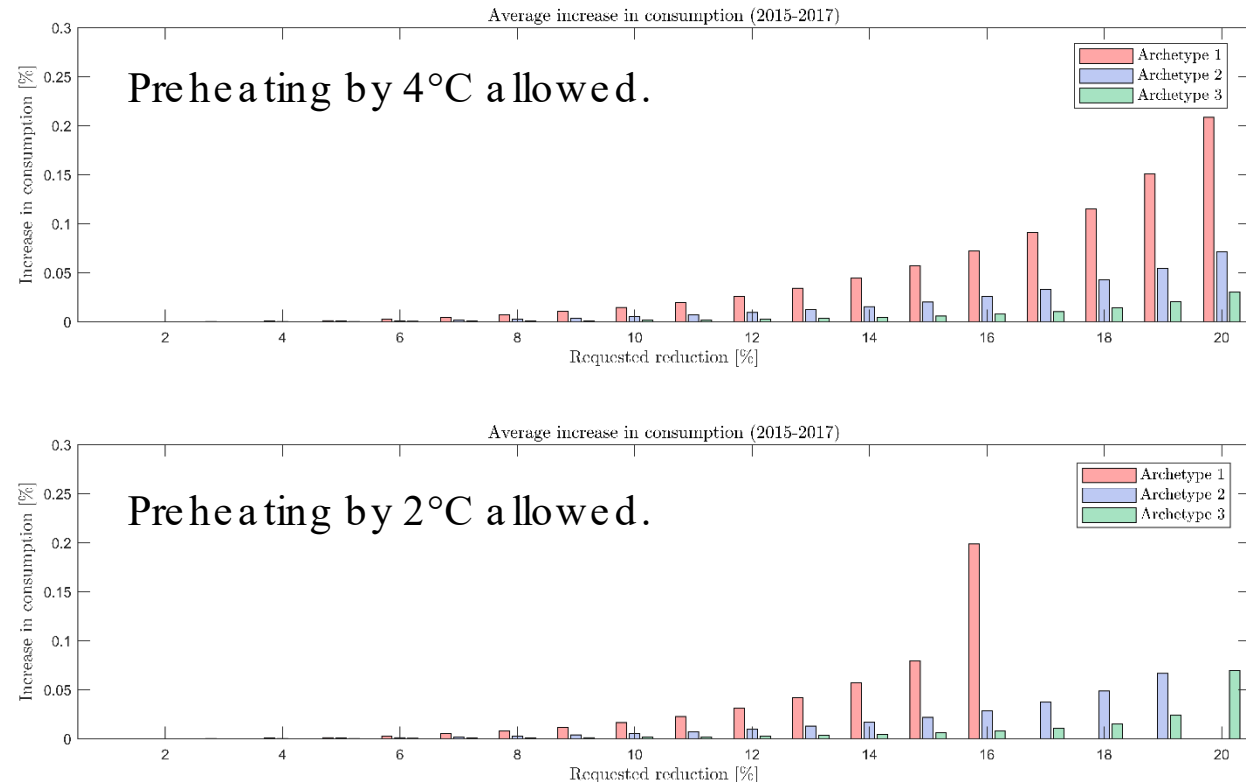

MAIN FINDINGS

Results indicated:

1. Significant capacity reductions may be achieved with only a modest increase in overall consumption.
2. Performance affected by:
 - Comfort preferences of occupants
 - Building energy efficiency

Energy retrofitting may benefit both **energy conservation** and **energy flexibility**.
