### **District heating domain**

• Faults in substations [1]:

- Comfort problem and physical faults
- Known faults but unsolved
- Faults which require new fault detection methods

[1]. Gadd, H., Werner, S.: Fault detection in district heating substations. Applied Energy 157 (2015) 51–59

# Hybrid method

Higher Order Mining [2]: mining from *derived data rather than raw data* Combination of methods:

- Sequential Pattern Mining > to find *frequently occurring patterns* with respect to a user-specified threshold.
- Clustering Analysis,
  - Weekly clustering > to group extracted patterns based on their similarities
  - Consensus clustering, -> to group patterns that are coming from two weeks explaining the same phenomenon.
- Minimum Spanning Tree -> to detect *outlying* patterns

[2] F. Roddick, M. Spiliopoulou, D. Lister, and A. Ceglar, "Higher order mining," ACM SIGKDD Explorations Newsletter, vol. 10, no. 1, pp. 5–17, 2008.

# Data & preprocessing

o Hourly numerical measurements, 2-year data

◦ Feature selection

- Outdoor temperature and *five* features:
  - 'sec\_delta\_t', 'prim\_delta\_t', 'consumed\_energy', volume\_flow', 'station\_effectivness'
  - station\_effectivness =

prim\_delta\_t

primary supply temperature – secondaryreturn temperature

Data categorization

- Transform the continues data into *four* categories
- *Four* seasons = *low, low\_medium, medium\_high, high*

### **Proposed method**

 $C_2$ 

 $\circ$  Given two clustering solutions of datasets *X* and *X*':

• 
$$C = \{C_1, C_2, ..., C_n\}$$
  
•  $C' = \{C'_1, C'_2, ..., C'_m\}$ 

$$\circ S_{W}(C,C') = \frac{\sum_{i=1}^{n} (min_{j=1}^{m} w_{i}.d(c_{i},c'_{j}))}{2} + \frac{\sum_{j=1}^{m} (min_{j=1}^{n} w'_{j}.d(c_{i},c'_{j}))}{2}$$
  
•  $w_{i} = \frac{|c_{i}|}{X}$   
•  $d$ , distance measure

### **Proposed method**

# Minimum spanning tree (MST)

 $\circ$  Given an undirected, connected, and weighted graph G=(V,E)

- a spanning tree of the graph G is a tree that covers all the nodes of G
- a tree with the minimum cost of traversing is called minimum spanning tree
- $_{\odot}$  MST is applied on top the clustering solutions
  - *V* = exemplars of the clusters
  - *E* = dissimilarity between *V*
- $_{\odot}$  Removing the longest edges
  - Smaller sub-trees are labeled as outlier

### Future work

![](_page_12_Figure_1.jpeg)

- $_{\odot}$  We aim to pursue further analysis and evaluation of the proposed approach
- $\circ$  In the long-term perspective,
  - Label weekly patterns with some *performance indicators*
