

6th International Conference on Smart Energy Systems
6-7 October 2020 #SESAAU2020

Early decarbonisation of the European energy system pays off

Marta Victoria, PhD
Assistant Professor
mvp@eng.au.dk

The challenge ahead

Methodology

$$\min \left(\sum_n \text{generation costs} + \text{storage costs} + \text{transmission costs} + \sum_{n,t} \text{variable costs} \right)$$

Subject to constraints :

$$\text{generation} + \text{balance} = \text{demand}$$

$$\sum \text{emissions} \leq CAP_{CO_2}$$

Strategies to balance renewables:

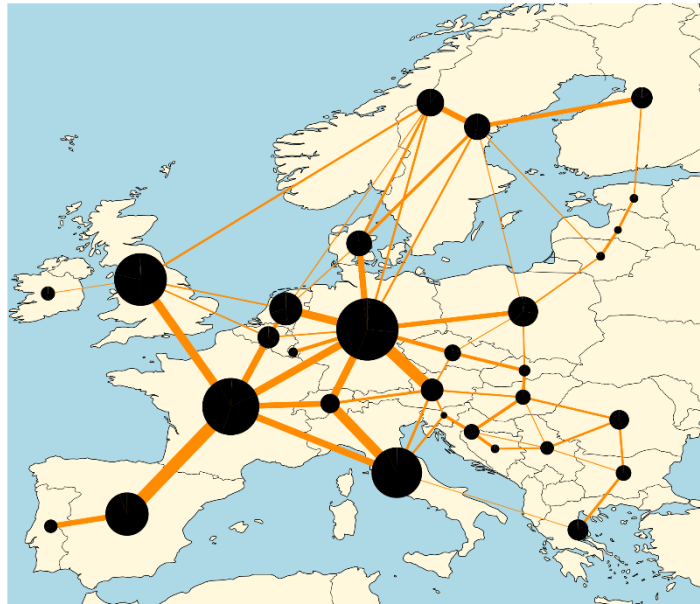

- Storage

- Reinforce interconnections

- Flexibility provided by sector coupling (electricity, heating and transport sectors)

open model : <https://github.com/martavp/pypsa-eur-sec-30-path>

+ open data : [10.5281/zenodo.4010644](https://zenodo.org/record/4010644)

+ open discussion : [arXiv:2004.11009](https://arxiv.org/abs/2004.11009)

ensures transparency and reproducibility

Transition paths with strict carbon budget

The cumulative carbon dioxide emissions from the European electricity and heating sector between 2020 and 2050 must remain below 21 Gt CO₂ to meet the Paris Agreement.

Results : Early and Steady vs Late and Rapid

The Early and Steady path is less expensive.

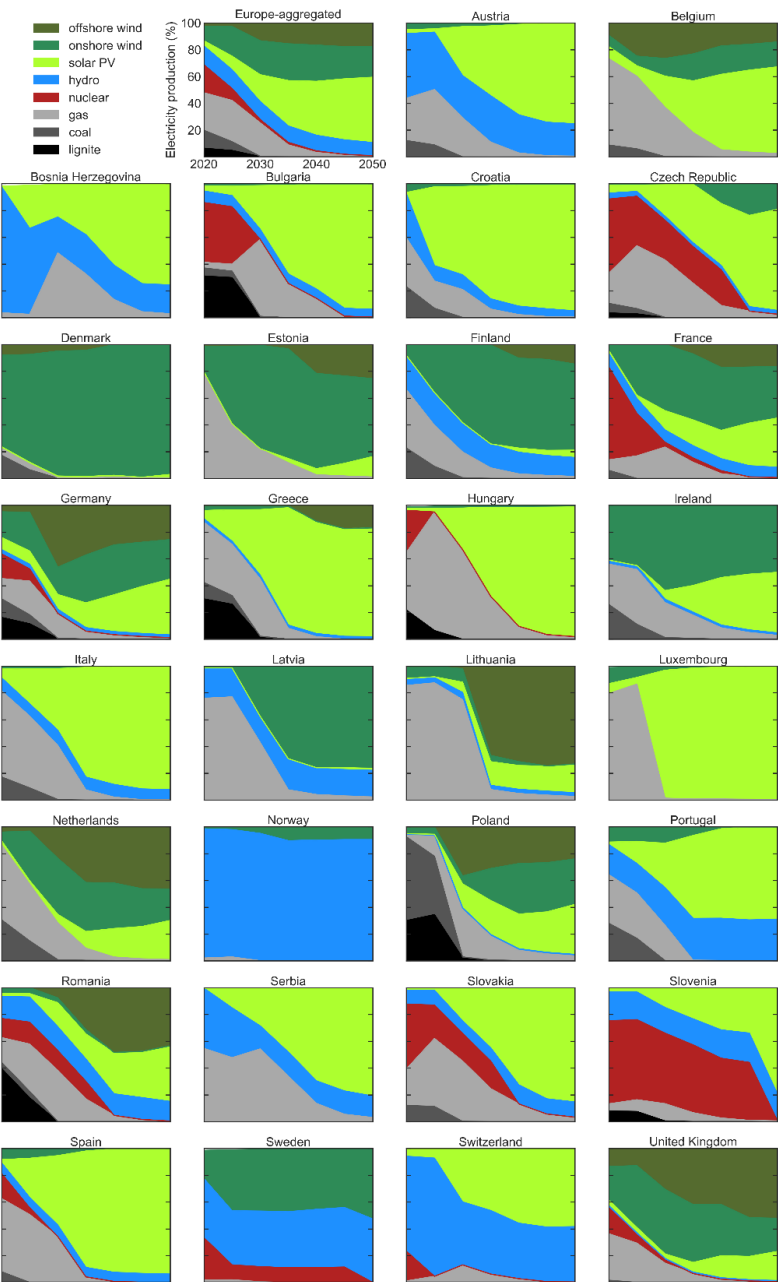

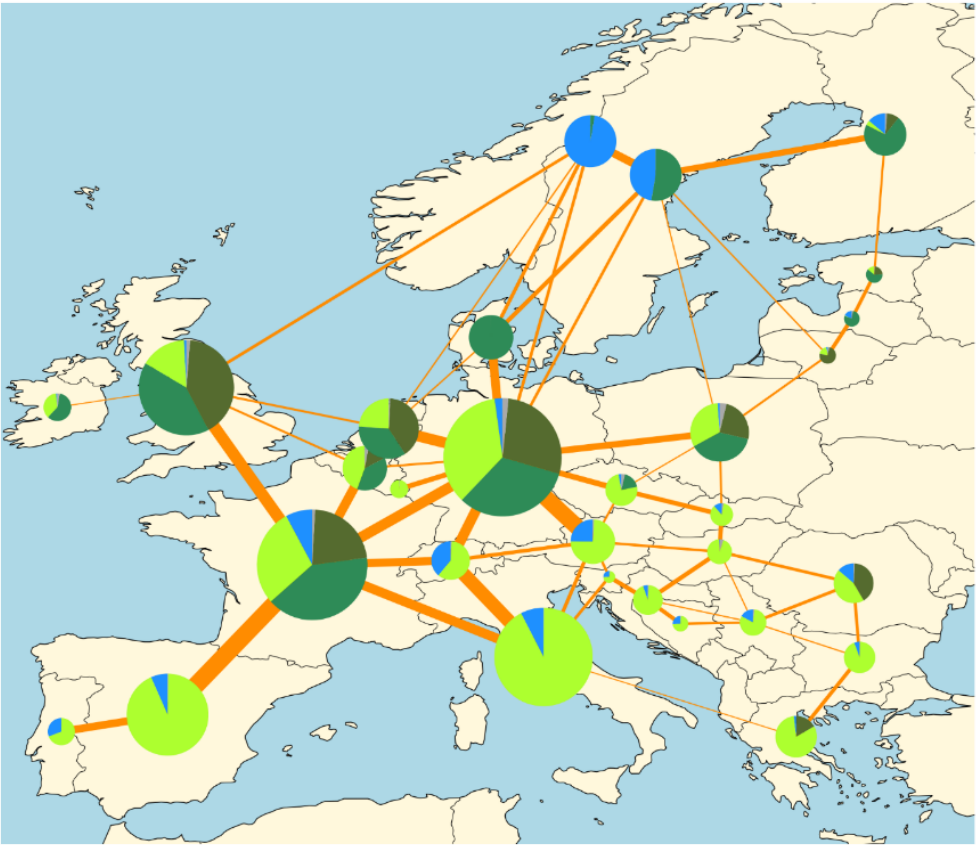

Results : Early and Steady vs Late and Rapid

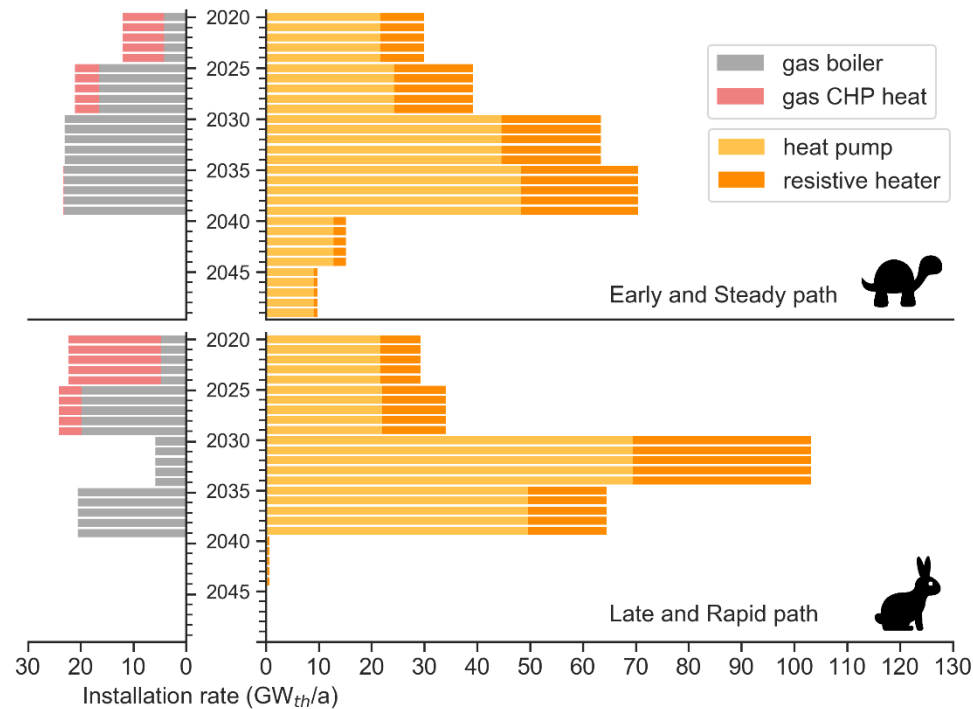

- Almost no new fuel-based electricity generation.
- Massive deployment of solar PV and wind, bioenergy play a small role
- Build rates similar to highest historical values.

Results: Cooperation among countries and technologies

Results : Early and Steady vs Late and Rapid

The electricity sector gets quickly decarbonised in both paths and more notable differences appear in new conventional heating capacities

Large seasonal variation in heating demand makes decarbonization in this sector more difficult

Results : Early and Steady vs Late and Rapid

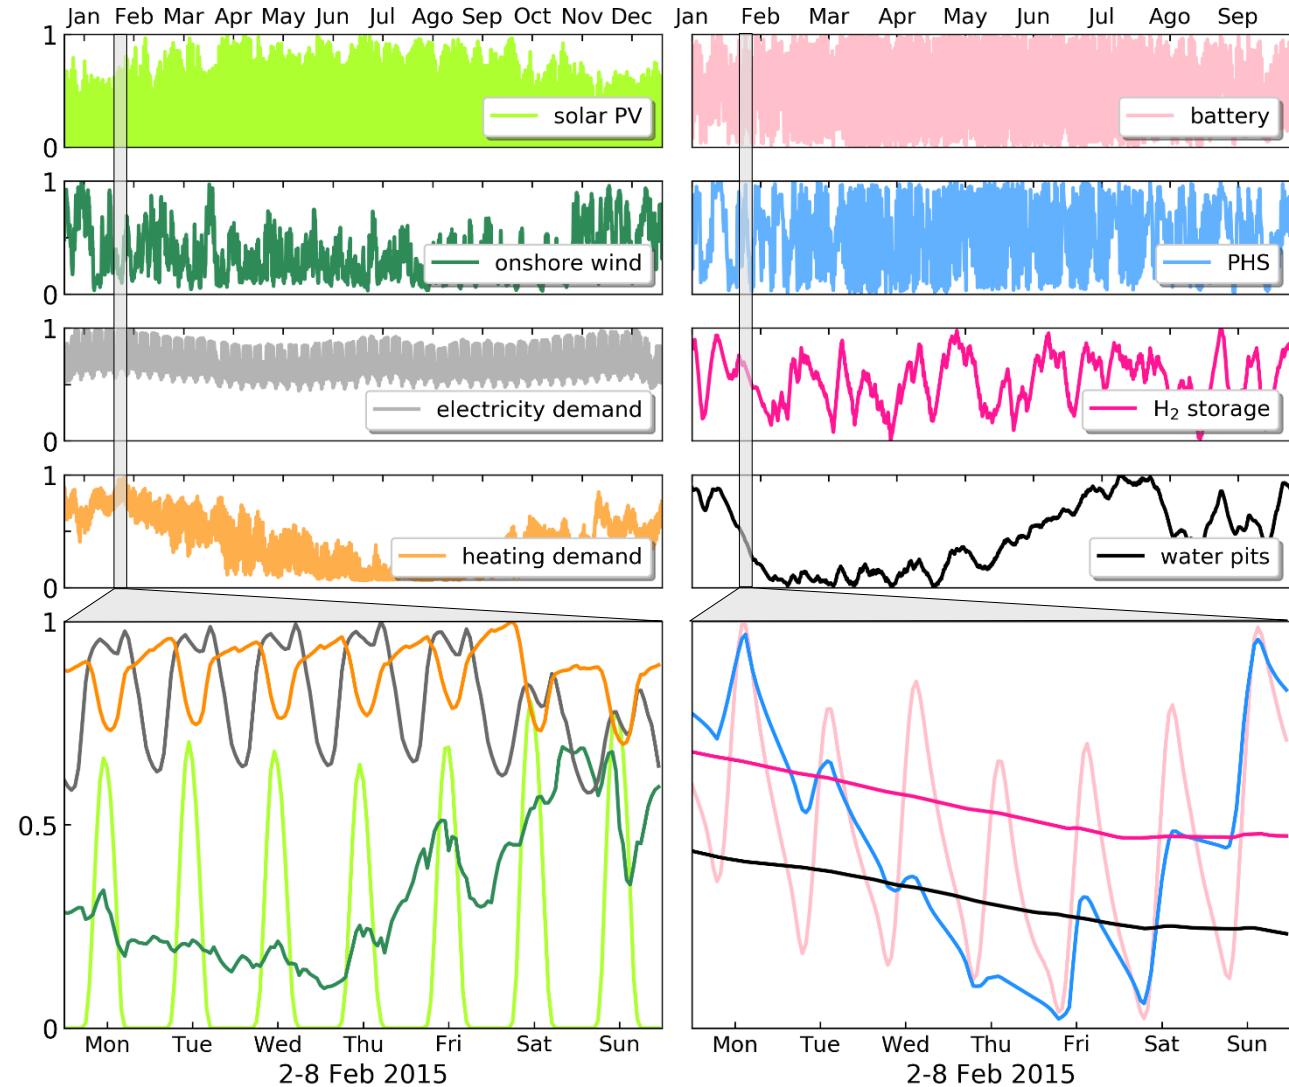

Gentle path incentivises more stable CO₂ prices.

Transition paths

Main features capture by hourly interrupted time stepping:

- solar and wind power generation smoothed by the grid and storage
- the role of long-term storage
- system operation during cold spells
