

Plenary Keynote: Kristian Jensen

CEO of Green Power Denmark

Energy security <--> secure energy

Abstract

Europe faces a dual challenge in its energy sector: ensuring a sufficient supply for the upcoming winter, and bolstering security against physical and digital threats. With a heavy reliance on imported natural gas, especially from Russia, Europe's energy security is subject to geopolitical tension, price spikes, and potential supply disruptions. Simultaneously, Europe's energy infrastructure is increasingly vulnerable to cyberattacks and terrorism, which could disrupt power supplies, manipulate energy prices, and cause extensive damage to infrastructure.

Mr. Kristian Jensen from Green Power Denmark will present their vision for tackling these interconnected issues. His solution lies in accelerating the shift to renewable energy sources to reduce reliance on imported natural gas. Renewable energy can also provide a decentralized energy infrastructure that is resilient to cyber and physical threats.
